MULCHING PAPER

The Mulching Paper consists of pure cellulose with no additives and it is produced in an extremely environmentally friendly process. There are no disposal problems after harvesting: as the mulching paper degrades, it can be returned into the soil or composted without "clean and dispose" problems.

FOR WHAT?	WHY?	HOW?
Open Ground Vegetables: Most lettuce and Cabbages, Endives, Parsley, Lettuce, Cauliflower, Fennel, etc. Glass House Crops: Various Lettuces and Bean Crops, Tomatoes, Peppers, Quinces, Pumpkins, Melons, etc. Out Flowers: Most annual Cut flowers: Carna- tions, Chrysanthemums, Gladioli, Violets etc. Tall Nurseries: Ornamental, Flowering and Plant Tree Cuttings, Flowering and Ornamental Shrubs, Conifers etc. also useful weed control in Container Crops.	Less weed, no use of herbici- cides + better root establish- ment of the soil + less evaporation of water + better moisture in soil + less rotteness of vegetables (i.e. lettuce) + clean base (avoid of voge- lation + no damage and disposal problems after harvest) as paper is 100% degradable.	Roll out the mulching paper on well prepared soil surface (not pulling tight) + cover edges with soil to prevent wind move- ments and movements owing to watering and watering of paper + when using mulching paper under glass waterfalls before planting is necessary Planting after paper is dry no more striking and stretch- ing of paper + 3-6 weeks after rolling out, the paper starts to rot in the edges + store the paper in dry rooms.

For big cultivations rolling out of paper by machine is an advantage owing to high elasticity of the paper. Length of rolls up to 500 m. Further informations about machines, perforations, lengths and widths and ways of packing you will receive from your retailer.
